Conclusion:

The customer presented with significant sway issues on their new (MAKE/MODEL) caravan. A comprehensive scope of service was undertaken, beginning with a detailed car and caravan weigh and compliance check, followed by a wheel alignment. The weight distribution analysis revealed an underweight tow ball and excessive weight at the rear of the caravan. To rectify this imbalance, the spare wheel was relocated to the front right-hand side storage compartment. This adjustment brought the weight distribution within safe limits — please refer to the attached weigh report for all relevant figures. Following the weight correction, a wheel alignment was conducted, with adjustments made in accordance with Cruisemaster alignment specifications — refer to the before-and-after report for full details.

The customer completed a test drive post-service and confirmed that the sway issue has been resolved. The caravan now handles safely and as expected.
